

Frankenstein reimagined

To what extent can fine-tuned LLMs replicate the **subconscious syntactic** signature?

Project Overview

Objectives

- Utilise trained Llama 3.1-8B on Mary Shelley's old novels to give more depth to the original 1818 Frankenstein novel
- Use Stylometric analysis to determine if model can mimic an author's writing style
- Enhance themes discussed in the text
-

Humanities Significance

Theme covered in AI version:

- Socioeconomic Recourse and Wealth
- Elizabeth's role as the voice of the marginalised
- Scientific ethical responsibility
- Abandonment and Social Rejection
- Justice system in the 18th century

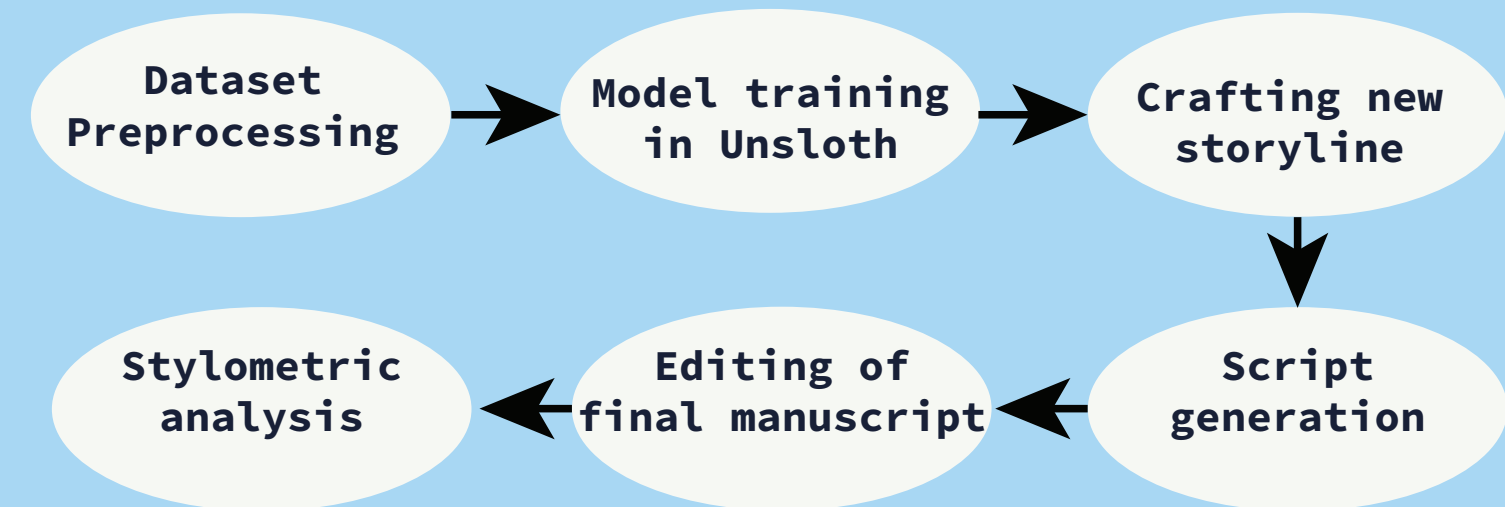

Questions for modified version

- What if Victor took responsibility for the creature?
- What if Elizabeth had a greater role in the story?
- What if the creature did not become a 'monster' ?

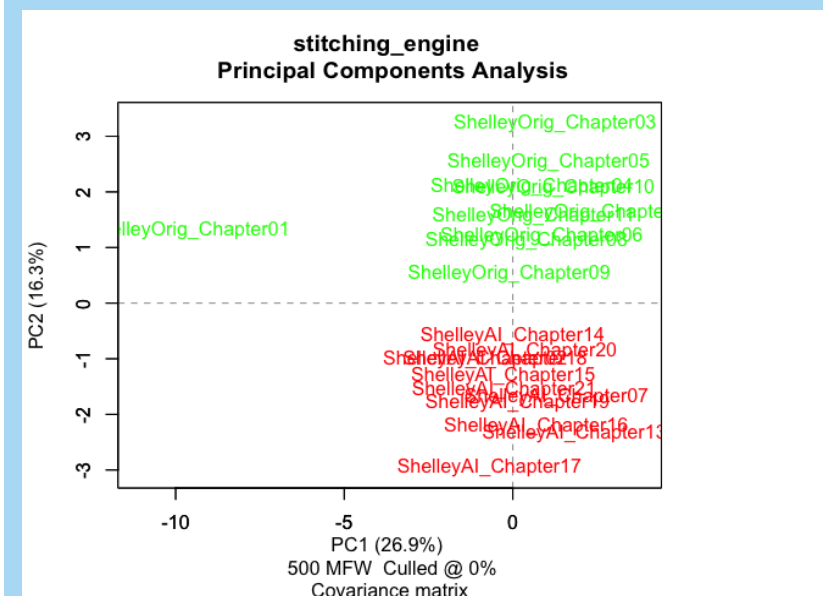

Conclusion

LLMs are still unable to effectively mimic **syntactic signatures** of authors but are able to replicate their use of vocabulary. AI interventions are still detectable by mathematical analysis methods. However, LLMs prove to be able to do more than just as a summarising tool.

Methodology

Evaluation results

Lexial similarity:

The analysis shows that the AI was able to effectively mimic Mary Shelley's use of vocabulary

Syntactic similarity:

The AI had trouble following Mary Shelley's syntactic rhythm

The anomaly:

The software managed to detect the shift from third to first-person in chapter 1 (Elizabeth's journal)
